DETAILED ACTION

Allowable Subject Matter

Claims 1 –10 are allowed.

The following is an examiner's statement of reasons for allowance:

The cited prior art neither teach nor fairly suggest a method for measuring low levels of a substance in a sample, wherein the method comprises the steps of:

- dispersing a plurality of paramagnetic particles in a colloidal solution;
- introducing an amount of the colloidal solution into a sample chamber;
- subjecting the sample chamber to a substantially uniform magnetic field;
- forming at least one substantially linear structure from the plurality of paramagnetic particles with the magnetic field;
- introducing a sample having low levels of the substance to be measured into the sample chamber for analysis;
- rotating the substantially uniform magnetic field at a constant rate to cause the substantially linear structure to rotate therewith;
- binding a portion of the substance to be measured in the sample to the substantially linear structure;
- detecting signals having a time-varying component originating from the sample chamber; and
- processing the signals with a lock-in amplifier to measure the time-varying component by improving the signal-to-noise ratio thereof using a reference signal having a frequency twice that of the rotation of the substantially uniform magnetic field as a multiplier to measure the low levels of the substance to be measured.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure: Kreuwel et al. teach a method of using magnetic particles in biological assays. Musha teaches a method of measuring a specific binding reaction employing magnetic particles having an antibody coating and using a polarized light beam and a magnetic field. Sugarman et al. teach an analytical device comprising a capillary mixing apparatus using magnetic particles. Mahan et al. teach an assay method using ligand-coated magnetic particles. King et al. teach a fluorometric immunological assay method using antibody-coated paramagnetic spheres.
